Mid Term Assignment Report
IADI 2020/21

- All **data models** implemented and respective **services**. Have yet to work on "Data Items" implementation. Right now it has a type of String but it has to change.

- All **controllers** are implemented and secure with **Spring Security**, minus controllers to create a student or reviewer that are exempt from authentication.

- I may need to introduce endpoints for altering existing objects (PUT).Right now I only have an endpoint to let the user change his password.

- I have few **tests**, just **for Institution**, **Reviewer** and **Student** entities.Moreso I couldn't implement tests for create methods (POST) in controller, because I'm having a problem with Gson library.

- I also added bitbucket-pipelines.yml, but it is not running all tests, I need to work on that too.

To finish, I think I have a good base to build the frontend, but I'm sure I will have to increment and extend some functionalities.
